
Exclusion of crevices in Building 1 b to be undertaken by Named Ecologist.
This will involve an endoscope check of crevices in internal and external walls, if no bats are present and the crevice can be fully checked, it will be plugged with upholsterer's foam. If a bat is present, or it is not possible to fully see the extent of the crevice, a standard 'one-way gate' device will be installed. The one-way gate will stay in place for at least a week of good weather (overnight temperatures at least 8C, no high winds or heavy persistent rain). After which, the device will be removed and the crevice plugged with upholsterer's foam.

Supervision of soft-strip of Buildings 1a and 1b during re-roofing.
The Named Ecologist will be present during careful removal by hand of ridge tiles, tiles and flashing. Any bats found will be captured by hand using a soft holding bag, and transferred immediately to a tree bat box.
