A sleek finish to your solar panels

SolaSkirt gives a great finish to any solar panel system, covering the gap, rail, clamps and rain-water run-off, all of which often makes on-roof solar PV systems look unattractive.

With its mechanical fixings and matt black, powder coated, clamps and skirt, its the best solution on the market.

Key Facts

- Improves the aesthetics of a PV system by fitting a skirt which covers rail, clamps, gaps and cable
- Does not affect airflow – there is still plenty of gaps between panels, between the panels and the SolaSkirt and under the SolaSkirt. Additionally all new build houses have in-roof solar with zero airflow and there are no reports of their output being affected
- No scaffolding needed, we install using rope access installers which is not only safer but also cheaper
- Prevents pigeons from getting under solar panels and causing damage
- Fits any panel with a thickness of 30mm – 50mm
- Matt Black powder coated aluminium sheet grade 1050 H15 and matt black clamps
- Easy and quick to fit with little cutting needed
- Supplied with pre-cut corners
- Unlike some mesh systems that drill into panels, voiding the warranty, SolaSkirt uses clamps that grip onto the frame of the panel, in the same way the mounting kit holding your panels onto the roof does
- Works with Roman tiles – the majority of our SolaSkirt installs have been on rooves with wavy tiles and it works just as well. If the ridges are particularly high the installers can adapt it as needed.
