Recycled Plastic Grids for parking area – provides a grass surface to retain the open feel of the site:

The Hebden 40 water permeable paving system from British Recycled Plastic provides quick and easy to install hard standing of any dimension, used in the creation of car parks, driveways, pathways etc.

Able to bear a 16 ton point load (and 250 tonnes per m2) the pavers provide incredibly strong ground reinforcement suitable for any UK road legal vehicle. The recycled plastic material is sourced from a single stream, providing the extra strength that makes the product so desirable.

The Hebden 40 pavers can be filled with either grass or gravel, creating an attractive finish that blends unobtrusively into the environment. It is perfect for areas requiring emergency vehicle access but where tarmac or block paving would spoil the aesthetic (e.g. stately homes), and to keep gravel driveways pristine by preventing migration of gravel.

When filled with seeded soil grass grows and covers the pavers quickly, while still allowing the grass to be mowed. The Hebden 40 prevents grassed areas from becoming boggy, making it easier to traverse either by foot or in vehicles.

Used successfully for this parking and turning area in front of a stone cottage renovation in Cheddleton:
